INTRODUCTION

For several years, Statistics Canada has been publishing a selection of labour force statistics on an annual basis. This year's edition contains several changes from previous publications. First, this edition has been subdivided into seven chapters to help users retrieve as quickly as possible series of interest. Second, there is an increased number of series which were requested by users. Third, tables on MCD (months of cyclical dominance) moving averages have been taken out but will be given to users upon request. The length of the MCD is still given when applicable. Fourth, the annual average section has been deleted from the present publication (a new publication containing annual averages will be published in the near future). The reader will also note that the time spans are not identical for all series. In fact, there are four time spans: 1953-1973, 1961-1973, 1965-1973, 1966-1973. These differences are due to such factors as changes in the collection and processing of the data, and changes in the sampling procedure.

The unadjusted statistics contained in this document are based on information obtained through a sample survey of households. Interviews are carried out in some 30,000 households chosen by area sampling methods across the country. The Labour Force Survey, started in November 1945, was taken at quarterly intervals until November 1952. Since then it has been carried out on a monthly basis. Estimates of employment, unemployment and non-labour force activity refer to the specific week covered by the survey each month.

The sample used in these surveys of the labour force has been designed to represent all persons in the population 14 years of age and over residing in Canada, with the following exceptions: residents of the Yukon and Northwest Territories, Indians living on reserves, inmates of institutions, and members of the armed forces. These exclusions amount to about 3% of the total population 14 years of age and over.

Estimates derived from a sample survey are subject to sampling and non-sampling errors. Aspects of this subject, as well as definitions and explanations relating to the Labour Force Survey, may be obtained by referring to the monthly publication *The Labour Force* (Statistics Canada, Catalogue 71-001). For a more detailed description of the survey, reference is made to *Canadian Labour Force Survey, Methodology* (Statistics Canada, Catalogue 71-504).

The series have been processed using the X-11 version of the *United States Bureau of the Census Method II Seasonal Adjustment Computer Program*.¹

¹ For a description of the technique see U.S. Bureau of the Census Technical Paper No. 15, *The X-11 Variant of the Census Method II Seasonal Adjustment Program*.

Depuis plusieurs années, Statistique Canada publie un recueil de statistiques annuelles sur la population active. La livraison de cette année comporte plusieurs modifications par rapport aux publications précédentes. Tout d'abord, elle est divisée en sept chapitres afin d'aider l'utilisateur à retrouver le plus rapidement possible les séries qui l'intéressent. Deuxièmement, on trouvera un plus grand nombre de séries demandées par les utilisateurs. En troisième lieu, on a supprimé les tableaux sur la moyenne mobile du mois de dominance cyclique (M.D.C.) qui pourront être fournis sur demande aux utilisateurs. La durée du M.D.C. est cependant donnée lorsque cela s'impose. Enfin, on a également supprimé de la présente publication la section de la moyenne annuelle; ces moyennes annuelles paraîtront bientôt dans un nouveau bulletin. Le lecteur remarquera également que les périodes sur lesquelles portent les séries ne sont pas toujours identiques. Il y a, en fait, quatre périodes: 1953-1973, 1961-1973, 1965-1973 et 1966-1973. Ces différences sont dues par exemple aux modifications introduites dans la collecte des données, le traitement des données ou dans les procédures d'échantillonnage.

Les données brutes du présent bulletin sont fondées sur les renseignements d'un sondage auprès des ménages. Environ 30,000 ménages choisis par échantillonnage aréolaire dans tout le pays sont interviewés. L'enquête sur la population active, inaugurée en novembre 1945, a été effectuée trimestriellement jusqu'en novembre 1952. Depuis lors, elle est effectuée tous les mois. Les estimations de l'emploi, du chômage et du nombre de personnes inactives portent sur une semaine déterminée chaque mois.

L'échantillon servant à l'enquête sur la population active a été conçu de façon à représenter toutes les personnes âgées de 14 ans et plus qui résident au Canada, exception faite des résidents du Yukon et des Territoires du Nord-Ouest, des Indiens des réserves, des pensionnaires des institutions et des militaires. Ces catégories exclues représentent environ 3 % de la population totale âgée de 14 ans et plus.

Les estimations tirées d'un sondage sont sujettes aux erreurs d'échantillonnage et aux erreurs d'observation. Les différents aspects de cette question ainsi que les définitions et les explications relatives à l'enquête sur la population active figurent dans la publication mensuelle intitulée *La population active* (Catalogue 71-001 de Statistique Canada). Une description plus détaillée de l'enquête est faite dans le *Canadian Labour Force Survey, Methodology* (Catalogue 71-504 de Statistique Canada).

Les séries ont été traitées à l'aide de la version X-11 du *United States Bureau of the Census Method II Seasonal Adjustment Computer Program*.¹

¹ On trouvera une description de la méthode en question dans le document suivant: U.S. Bureau of the Census Technical Paper No. 15, *"The X-11 Variant of the Census Method II Seasonal Adjustment Program"*.

Seasonally-adjusted labour force estimates may be obtained by direct adjustment or by summing seasonally-adjusted employment and seasonally-adjusted unemployment. In this report, the summation method has been used in Chapter 1, while the direct method has been used in Chapters 6 and 7.

Seasonally-adjusted unemployment rates are always calculated by dividing the seasonally-adjusted unemployment level by the sum of the seasonally-adjusted employment and unemployment levels (i.e. seasonally-adjusted labour force by summation).

For each data series included in this publication, three tables have been presented:

1. The unadjusted data. All estimates derived from the Labour Force Survey are rounded to thousands.
2. The final seasonal factors. Included in this table are forecast factors for the coming year.
3. The final seasonally-adjusted series. This table is obtained by dividing the unadjusted data for each month by the respective final seasonal factor.

Pour savoir quels sont les estimations désaisonnalisées de la population active, on peut procéder par ajustement direct ou par sommation de l'emploi désaisonnalisé et du chômage désaisonnalisé. Dans la présente publication on a fait appel à la méthode par sommation au chapitre 1, tandis que la méthode directe a été utilisée aux chapitres 6 et 7.

Pour le calcul de tous les taux de chômage désaisonnalisés, on divise le nombre désaisonnalisé des chômeurs par la somme de l'emploi désaisonnalisé et du chômage désaisonnalisé (qui représente la population active désaisonnalisée obtenue par sommation).

Pour chaque série de données présentée, dans le présent bulletin, on trouvera trois tableaux disposés dans l'ordre suivant:

1. Les données non désaisonnalisées. Toutes les estimations tirées de l'enquête sur la population active sont arrondies au millier.
2. Les facteurs finals de désaisonnalisation. Le tableau indique également les facteurs prévus pour l'année à venir.
3. La série finale de données désaisonnalisées. On obtient le tableau en divisant chaque mois les données non désaisonnalisées par le facteur saisonnier final correspondant.

INTRODUCTION

Each year, Statistics Canada publishes a selection of historical labour force statistics and related seasonal adjustment information. This issue presents the monthly estimates up to the end of 1974 and forecast seasonal factors for 1975. It should be noted that four different time spans are used, depending on the series: 1953-1974, 1961-1974, 1965-1974 and 1966-1974. The different starting points have arisen primarily because of changes in the collection and processing of the data and changes in the sampling procedure.

The unadjusted statistics contained in this document are based on information obtained through a sample survey of households. Interviews are carried out in some 30,000 households chosen by area sampling methods across the country. The Labour Force Survey, which was begun in November 1945, was taken at quarterly intervals until November 1952. Since then it has been carried out on a monthly basis. Estimates of employment, unemployment and non-labour force activity refer to the specific week covered by the survey each month.

The sample used in these surveys of the labour force has been designed to represent all persons 14 years of age and over residing in Canada, with the following exceptions: residents of the Yukon and Northwest Territories, Indians living on reserves, inmates of institutions, and members of the armed forces. These exclusions amount to about 3% of the total population 14 years of age and over.

Estimates derived from a sample survey are subject to sampling and non-sampling errors. Descriptions of sampling procedures, as well as concepts and definitions relating to the Labour Force Survey, may be obtained by referring to the monthly publication *The Labour Force* (Statistics Canada, Catalogue 71-001). For a more detailed description of the survey, refer to *Canadian Labour Force Survey, Methodology* (Statistics Canada, Catalogue 71-504).

The seasonally-adjusted series in this publication have been derived using the X-II version of the United States Bureau of the Census Method II Seasonal Adjustment Computer Program.¹

Seasonally-adjusted estimates of the labour force may be obtained either by direct adjustment or by summing seasonally-adjusted employment and seasonally-adjusted unemployment. In this report, the summation method has been used in Chapter 1, while the direct method has been used in Chapters 6 and 7.

Chaque année, Statistique Canada publie un recueil de statistiques chronologiques sur la population active ainsi que les données de désaisonnalisation qui s'y rapportent. La présente édition regroupe les estimations mensuelles jusqu'à la fin de 1974 et les facteurs saisonniers de prévision pour 1975. Il y a, en fait, quatre périodes suivant les séries: 1953-1974, 1961-1974, 1965-1974 et 1966-1974. Ces différences sont imputables principalement aux modifications introduites dans la collecte des données et leur traitement, ou dans les procédures d'échantillonnage.

Les données brutes présentées ici sont fondées sur les renseignements d'un sondage auprès des ménages. Environ 30,000 ménages choisis par échantillonnage aréolaire dans tout le pays sont interviewés. L'enquête sur la population active, inaugurée en novembre 1945, a été effectuée trimestriellement jusqu'en novembre 1952. Depuis lors, elle est effectuée tous les mois. Les estimations de l'emploi, du chômage et du nombre d'inactifs portent sur une semaine déterminée chaque mois.

L'échantillon servant à l'enquête sur la population active a été conçu de façon à représenter toutes les personnes âgées de 14 ans et plus qui résident au Canada, exception faite des résidents du Yukon et des Territoires du Nord-Ouest, des Indiens des réserves, des pensionnaires des institutions et des militaires. Ces catégories exclues représentent environ 3 % de la population totale âgée de 14 ans et plus.

Les estimations tirées d'un sondage sont sujettes aux erreurs d'échantillonnage et à d'autres erreurs. Les différents aspects de cette question ainsi que les définitions et les explications relatives à l'enquête sur la population active se trouvent dans la publication mensuelle intitulée *La population active* (71-001 au catalogue de Statistique Canada). Une description plus détaillée de l'enquête est faite dans *l'Enquête sur la population active du Canada, Méthodologie* (71-504F au catalogue de Statistique Canada).

Les séries ont été traitées à l'aide de la version X-II du *United States Bureau of the Census Method II Seasonal Adjustment Computer Program*¹.

Pour calculer les estimations désaisonnalisées de la population active, on peut procéder par ajustement direct ou par sommation de l'emploi désaisonnalisé et du chômage désaisonnalisé. Dans la présente publication, on a fait appel à la méthode par sommation au chapitre 1, tandis que la méthode directe a été utilisée aux chapitres 6 et 7.

¹ For a description of the technique see U.S. Bureau of the Census Technical Paper No. 15, *The X-II Variant of the Census Method II Seasonal Adjustment Program*.

¹ On trouvera une description de la méthode en question dans le document suivant: U.S. Bureau of the Census Technical Paper No. 15, "The X-II Variant of the Census Method II Seasonal Adjustment Program".

Seasonally-adjusted unemployment rates are always calculated by dividing the seasonally-adjusted unemployment level by the sum of the seasonally-adjusted employment and unemployment levels (i.e., seasonally-adjusted labour force by summation).

For each series included in this publication, the following tables are presented:

1. The unadjusted data, rounded to thousands.
2. The final seasonal factors (for directly adjusted series only). Included in this table are forecast factors for the coming year.
3. The final seasonally-adjusted series, rounded to thousands. For directly adjusted series, this table is obtained by dividing the unadjusted data for each month by the appropriate final seasonal factor.
4. The length of the MCD (months of cyclical dominance) is given when applicable. The complete tables are available on request.

Over the last year Statistics Canada has developed a modification to the X-II seasonal adjustment program designed to improve the accuracy of seasonal factor forecasts for a number of labour force series. The modification consists of substituting seasonal factor forecasts generated through the use of ARIMA (auto-regressive integrated moving average) models of the Box and Jenkins type for the seasonal factor forecasts made by the X-II seasonal adjustment program. A technical description of the procedures used is available from the Labour Force Survey Division or the General Time Series Staff, Statistics Canada.

In the past, the forecast seasonal factors have been used to derive the seasonally-adjusted figures throughout the current year. Starting in January 1975, seasonally-adjusted figures will be calculated on a current basis; that is, the seasonal adjustment program will be run on the series using data up to and including the most recent month. This process will generate new forecast factors for the remainder of the year, which will be available on request. As in past years, there will be a revision of the seasonally-adjusted figures at the end of the calendar year, but it is expected that the resultant changes will not be as large as in previous years since changes in seasonal patterns will have been taken into account more quickly.

Pour le calcul de tous les taux de chômage désaisonnalisés, on divise le nombre désaisonnalisé des chômeurs par la somme de l'emploi désaisonnalisé et du chômage désaisonnalisé (c.-à-d. la population active désaisonnalisée obtenue par sommation).

Pour chaque série de données présentée ici, on trouvera trois tableaux disposés dans l'ordre suivant:

1. Les données non désaisonnalisées, arrondies au millier.
2. Les facteurs finals de désaisonnalisation (pour les séries désaisonnalisées directement). Le tableau donne également les facteurs de prévision pour l'année à venir.
3. La série finale des données désaisonnalisées, arrondie au millier. Dans le cas des séries désaisonnalisées directement, on obtient le tableau en divisant les données non désaisonnalisées pour chaque mois par le facteur saisonnier final correspondant.
4. La durée du M.D.C. (mois de dominance cyclique) est donnée lorsque cela s'impose. L'ensemble des tableaux est disponible sur demande.

Au cours de l'année écoulée, Statistique Canada a apporté une modification au programme X-II de désaisonnalisation dans le but d'améliorer l'exactitude des prévisions de facteurs saisonniers pour certaines séries sur la population active en substituant celles obtenues par l'emploi de modèles A.R.M.M.I. (modèles autorégressifs et de moyenne mobile intégrée) du type Box et Jenkins aux prévisions de facteurs saisonniers produites par le programme X-II. On peut se procurer une description technique des méthodes utilisées auprès de la Division de l'enquête sur la population active ou du Service des séries chronologiques générales, Statistique Canada.

Dans le passé, on s'est servi des facteurs saisonniers de prévision pour calculer les données désaisonnalisées tout au long de l'année en cours. À partir de janvier 1975, ces données seront calculées sur une base courante. En d'autres termes, le programme de désaisonnalisation s'appliquera aux séries qui utilisent des données portant jusqu'au mois le plus récent inclusivement. De cette façon, on pourra obtenir de nouveaux facteurs de prévision pour le reste de l'année, facteurs qui seront disponibles sur demande. Comme dans le passé, les données désaisonnalisées seront révisées à la fin de l'année civile, mais les variations ne devraient pas être aussi marquées, puisqu'on aura tenu compte plus rapidement des variations de la tendance saisonnière.
